[Paper]   [GitHub]

Example results on several image-to-image translation problems. In each case we use the same architecture and objective, simply training on different data.

Abstract

We investigate conditional adversarial networks as a general-purpose solution to image-to-image translation problems. These networks not only learn the mapping from input image to output image, but also learn a loss function to train this mapping. This makes it possible to apply the same generic approach to problems that traditionally would require very different loss formulations. We demonstrate that this approach is effective at synthesizing photos from label maps, reconstructing objects from edge maps, and colorizing images, among other tasks. As a community, we no longer hand-engineer our mapping functions, and this work suggests we can achieve reasonable results without hand-engineering our loss functions either.

Try our code

Recommended version: [PyTorch]
Original code: [Torch]

Ports of our code:
[Tensorflow] (tutorial on Tensorflow Core)
[Tensorflow] (implementation by Christopher Hesse)
[Tensorflow] (implementation by Yen-Chen Lin)
[Chainer] (implementation by pfnet-research)
[Keras] (implementation by Thibault de Boissiere)
[Wolfram Cloud] (implementation by Wolfram team)

Facades

Effect of the generator architecture
Cityscapes

**Effect of the discriminator patch scale**
Cityscapes
Facades

Additional results
Map to aerial
Aerial to map
Semantic segmentation
Day to night
Edges to handbags
Edges to shoes
Sketches to handbags
Sketches to shoes

Community contributions: #pix2pix

People have used our code for many creative applications, often posted on twitter with the hashtag #pix2pix. Check them out here! Below we highlight ju a few of the many:

Human Allocation of Space
Scott Eaton uses a customized version of pix2pix as a tool in his artwork, for example training a net to translate from

Learning to See: Gloomy Sunday
Memo Akten used pix2pix to create the very compelling music video linked above, in which common household items, like a powercord, are moved around in a pantomine of crashing waves and blooming flowers. Then a pix2pix-based model translates the

Suggestive Drawing
Nono Martinez Alonso used pix2pix for his masters thesis on human-AI collaboration for design. Different pix2pix models are used as aids for a human designer, where they "suggest" extensions, refinements, and completions of the designer's sketches.

sketches and brush strokes to 3D renderings. The sculpture above is an actual brozne cast derived from one of Scott's translated designs. You can find more of his AI-empowered artwork here.

pantomine into renderings of the imagined objects.

#edges2cats

Christopher Hesse trained our model on converting edge maps to photos of cats, and included this in his interactive demo. Apparently, this is what the Internet wanted most, and #edges2cats briefly went viral. The above cats were designed by Vitaly Vidmirov (@vvid).

Alternative Face

Mario Klingemann used our code to translate the appearance of French singer Francoise Hardy onto Kellyanne Conway's infamous "alternative facts" interview. Interesting articles about it can be read here and here.

Person-to-Person

Brannon Dorsey recorded himself mimicking frames from a video of Ray Kurzweil giving a talk. He then used this data to train a Dorsey→Kurzweil translator, allowing him to become a kind of puppeter in control of Kurzweil's appearance.

Interactive Anime

Bertrand Gondouin trained our method to translate sketches→Pokemon, resulting in an interactive drawing tool.

Background masking

Kaihu Chen performed a number of interesting experiments using our method, including getting it to mask out the background of a portrait as shown above.

Color palette completion
Colormind adapted our code to predict a complete 5-color palette given a subset of the palette as input. This application stretches the definition of what counts as "image-to-image translation" in an exciting way: if you can visualize your input/output data as images, then image-to-image methods are applicable! (not that this is necessarily the best choice of representation, just one to think about.)

Recent Related Work

Generative adversarial networks have been vigorously explored in the last two years, and many conditional variants have been proposed. Please see the discussion of related work in our paper. Below we point out three papers that especially influenced this work: the original GAN paper from Goodfellow et al., the DCGAN framework, from which our code is derived, and the iGAN paper, from our lab, that first explored the idea of using GANs for mapping user strokes to images.
